

The Cloud Resume Challenge - Azure

Muhammad Haseeb

September 11, 2025

Introduction

This report documents the work performed with **Azure Functions** and **Azure Storage Account**. The tasks include setting up an HTTP-triggered function locally and deploying a static portfolio website through Azure Storage.

Part 1: Azure Storage Account & Portfolio Deployment

Steps Performed

- Created an **Azure Storage Account**.
- Configured **data management** and containers.
- Enabled **Static Website Hosting**.
- Uploaded `index.html` to the `$web` container.
- Successfully deployed portfolio website.

Deployed Website

The portfolio is accessible at: <https://resumehaseeb.z23.web.core.windows.net/>

Storage Structure

- **Storage Account** → resumehaseeb
- **Containers** → \$web
- **Uploaded Files** → index.html

Current Status

- Portfolio website is live and accessible.
- Azure Function runtime starts successfully, but function creation is stuck due to template download errors.

Next Steps

- Retry func new after clearing lock files and ensuring stable internet:

```
del C:\Users\haseebay\.azurefunctions\func_bundle_templates.lock
func templates install --force
```

- Proceed to integrate the Visitor Counter function with the static website.

Part 2: Visitor Counter Function Setup

Environment Setup

- Navigated to the project folder:

```
cd C:\Users\haseebay\Desktop\cloud\VisitorCounterApp
```

- Created and activated a Python virtual environment:

```
py -3.10 -m venv .venv
.venv\Scripts\activate
```

- Installed requirements:

```
pip install -r requirements.txt
```

Function Host Start

```
func start
```

This successfully launched the local runtime for Azure Functions.

Issue: Function Creation

Tried creating an HTTP-triggered function:

```
func new --name VisitorCounter --template "HTTP trigger" --authlevel "anonymous"
```

Errors:

- Timeout during template fetch:

```
The request was canceled due to the configured
HttpClient.Timeout of 100 seconds elapsing.
```

- Lock file issue:

```
Could not acquire file lock on
C:\Users\haseebay\.azurefunctions\func_bundle_templates.lock
```

Conclusion

In this task, I successfully deployed my personal portfolio using an **Azure Storage Account** with static website hosting. The portfolio is now live and accessible at: <https://resumehaseeb.z23.web.core.windows.net/>

Additionally, I set up the environment for the **Visitor Counter Function** using Azure Functions Core Tools. While the function host runs correctly, creating a new HTTP-triggered function is currently blocked due to template download and lock file issues.

Overall, the project demonstrates practical skills in **cloud deployment, storage management, and serverless functions**. The next steps involve resolving the function creation issue and integrating the Visitor Counter with the deployed portfolio website.
